Geotechnical Design for Sublevel Open Stopping By Ernesto Villaescusa

The first comprehensive work on one of the most important underground mining methods worldwide, **Geotechnical Design for Sublevel Open Stopping** presents topics according to the conventional sublevel stopping process used by most mining houses, in which a sublevel stopping geometry is chosen for a particular mining method, equipment availability, and work force experience. Summarizing state-of-the-art practices encountered during his 25+ years of experience at industry-leading underground mines, the author:

- Covers the design and operation of sublevel open stopping, including variants such as bench stopping
- Discusses increases in sublevel spacing due to advances in the drilling of longer and accurate production holes, as well as advances in explosive types, charges, and initiation systems
- Considers improvements in slot rising through vertical crater retreat, inverse drop rise, and raise boring
- Devotes a chapter to rock mass characterization, since increases in sublevel spacing have meant that larger, unsupported stope walls must stand without collapsing
- Describes methodologies to design optimum open spans and pillars, rock reinforcement of development access and stope walls, and fill masses to support the resulting stope voids
- Reviews the sequencing of stopping blocks to minimize *in situ* stress concentrations
- Examines dilution control action plans and techniques to back-analyze and optimize stope wall performance

Featuring numerous case studies from the world-renowned Mount Isa Mines and examples from underground mines in Western Australia, **Geotechnical Design for Sublevel Open Stopping** is both a practical reference for industry and a specialized textbook for advanced undergraduate and postgraduate mining studies.

Editorial Review

Review

"Because of its continuing importance in most of the world's major metalliferous mining countries including, but not only, Australia, Canada, and the Scandinavian and South American countries, it is entirely appropriate that a book should now appear synthesizing 40 years' accumulated international experience with modern sublevel open stopping methods. ... The author...is supremely well qualified to undertake this important task...because of his directly relevant industry, applied research, teaching and consulting experience, and his extensive list of publications in the area. ...Although, as the title suggests, the book has a geotechnical engineering orientation, it also contains considerable practical detail on open stopping layouts, design, and operations, and includes chapters on drilling and blasting, rock support and reinforcement, mine fill technology, and dilution control. ...I believe that this book will serve multiple purposes. It will serve as a specialist textbook for mining courses at the advanced undergraduate and postgraduate levels. It will also provide an authoritative, practically oriented reference work for those involved in the industry, both in mining operations and as consulting engineers, particularly for those in the early stages of their careers and those seeking to develop new understandings and skills."

?From the Foreword by Edwin T. Brown, AC, Senior Consultant, Golder Associates Pty Ltd, Brisbane, Australia and Emeritus Professor, University of Queensland, Australia
