The Mental Representation of Trait and Autobiographical Knowledge About the Self (Advances in Social Cognition, Vol 5) From Brand: Psychology Press

If there is one topic on which we all are experts, it is ourselves. Psychologists depend upon this expertise, as asking people questions about themselves is an important means by which they gather the data that provide much of the evidence for psychological theory. Personal recollections play an important role in clinical theorizing; people's thoughts, feelings, and beliefs provide the principal data for attitudinal research; and judgments of one's traits and descriptions of one's goals and motivations are essential for the study of personality. Yet despite their long dependence on self-report data, psychologists know very little about this basic resource and the processes that govern it. In spite of the importance of the self as a concept in psychology, virtually no empirically-tested representational models of self-knowledge can be found. Recently, however, several theoretical accounts of the representation of self-knowledge have been proposed. These models have been concerned primarily with the factors underlying a particular type of self knowledge -- our trait conceptions of ourselves. The models all share the starting assumption that the source of our knowledge of the traits that describe us is memory for our past behavior.

The lead article in this volume reviews the available models of the processes underlying trait self-descriptiveness judgments. Although these models appear quite different in their basic representational assumptions, exemplar and abstraction models sometimes are difficult to distinguish experimentally. Presenting a series of studies using several new techniques which the authors believe are effective for assessing whether people recruit specific exemplars or abstract trait summaries when making trait judgments about themselves, they conclude that specific behavioral exemplars play a far smaller role in the representation of trait knowledge than previously has been assumed. Finally, the limitations of social cognition paradigms as methods for studying the representation of long-term social knowledge are discussed, and the implications of the research for both existing and future social psychological research are explored.
